► **CIVIL CONSTRUCTION**

Project:

Environmental Rescue & Emergency Repair

Location:

Hollywood, FL

Profile:

Lanzo Construction Company was called to perform an urgent, environmentally sensitive, underground utility repair where active effluent was escaping and contaminating the Intracoastal Water Way. A 60" Force Main was punctured during a city sponsored geological survey being conducted on the Hollywood pump station property. The pump station area is located on a low lying barrier island along the Intracoastal Water Way so getting to this repair required expertise, sensitivity and most importantly, expediency.

After a thorough assessment, Lanzo constructed a 30' vertical shaft in order to access the damaged PCCP. The sheeted shaft also served as the bulk head and was sealed from the environmentally sensitive Intracoastal Water Way. Lanzo then removed one punctured joint and replaced it with a new 60" PCCP joint.

Lanzo's well-known technical expertise in critical utility repair and installation work resulted in an expedited and permanent fix to a potential ecological disaster.
